

COOL WAVE PANSIES

General Information:

Cool Wave Pansies have been developed for outstanding spring performance. It's superior breeding has created a winter hardy pansy that will flush out and flourish in the warm days of spring. It's blooms hold up in the rain and weather better than any other pansy variety on the market.

Cool Wave Pansies are the best trailing pansies for baskets and beds. These vigorous plants ultimately spread up to 18 to 24 inches in the ground. Colors range from white, yellow, frost, violet wing, and a mixture.

Light:

Pansies prefer a SUNNY SPOT. Shade makes them stretch and cuts down on the number of flowers produced. They will, however, tolerate very light shade, and a couple of hours of shade in the hot afternoon is to their liking.

Watering:

Plant pansies in moist, (NOT wet) fertile soil. If pansies dry out, or are nutrient starved, their vigor declines very quickly. Baskets and clay containers will probably need watering every day in temperatures above 75°

Fertilizer:

Feed pansies with either: 1- a granular flower food 2- a water-soluble food like Peters or Miracle-Gro, every other watering or 3- A slow release pellet like Osmocote.

Maintenance:

Remove the spent flower heads before they form seeds. Energy that could be going into the production of new flowers is wasted on formation of seeds if the faded flowers aren't picked off regularly. Remove the entire flower stem, not just the flower on the end. Pinching is fine, or use scissors.

Many gardeners ask if pansies will bloom all summer. The answer depends on several factors - the amount of care they receive, the heat tolerance of the variety planted, and summer rainfall and temperatures. Pansies should not be thought of as a replacement for main-stream annuals like marigolds and petunias, but as a preview to them. Many gardeners prefer to remove their pansies once the hot weather hits, and replace them with heat-loving annuals. Others will cut their pansies back in mid-July, and allow them to grow again for fall blooms. Still others grow their pansies in containers on their porches and patios so that they have lots of color while waiting for the mainstream flowers to grow.
